

1. Get into the right folder

`Cd /MDNA-Server/zDNAMicroservice/ssoManager`

Confirm you're in the right place — `firebase.json` and `index.js` should be listed:

`ls firebase.json index.js src`

2. Log in

`firebase login`

Opens a browser for Google auth. If it says you're already logged in as the wrong account:

`firebase login --reauth`

3. Point at the right project

`firebase projects:list`

`firebase use dnacloud-demo2-t`

Getting this wrong deploys to the wrong environment, so check the output says `dnacloud-demo2-t`.

4. Pre-flight — catch syntax errors before a 5-minute build

`node --check src/services/db/postgresSSO.service.js && node --check src/services/SSO/userResolution.service.js && node --check src/utils/oidc/tokenExchange.util.js && echo "all parse OK"`

5. Deploy

`firebase deploy --only functions:sso`

Bare `firebase deploy` also works but pushes hosting and rules too. Wait for `Deploy complete!`.

6. Restore the env vars the deploy wipes ⚠

Every `firebase deploy` drops `DATABASE_URL` and `VPC egress` on this service. Skip this and the service comes up unable to reach Postgres. Run in **Cloud Shell** (bash — the `$(...)` and `jq` won't survive PowerShell):

```
gcloud run services update sso --region us-central1 --project dnacloud-demo2-t
--network=dnacloud-demo2-t-gke-vpc --subnet=dnacloud-demo2-t-gke-subnet
--vpc-egress=private-ranges-only --max-instances=1 --update-env-vars
"^|^DATABASE_URL=$(gcloud run revisions describe sso-00150-nob --region us-central1
--project dnacloud-demo2-t --format='json' | jq -r '.. | objects |
select(.name=="DATABASE_URL") | .value' | head -1)"
```

Confirm it took:

```
gcloud run services describe sso --region us-central1 --project dnacloud-demo2-t --format=json |
jq -r '.spec.template.spec.containers[0].env[] | select(.name=="DATABASE_URL") | .value'
```

Empty output means re-run it.

7. Verify the new revision is serving

```
gcloud run revisions list --service sso --region us-central1 --project dnacloud-demo2-t --limit 3
--format='table(name,active,creationTimestamp)'
```

The newest should be `active` with a timestamp from now.
